> correctness."

Why not Rust?

- Limits the creative flow with it's constraints. No driving your car off the cliff for fun.
- Compiler is your friend and your foe. Lifetimes are difficult and the compiler will give you hints.
- Large cognitive load to learn.
- Compile time is longer (than Go, etc)
- You want quick code to production and you are happy to have errors in production - Rust causes you to think about edge cases and errors earlier. You pay early with Rust.
- Not Popular - https://madnight.github.io/githut
- Many prefer Go (for webservers and quick

Thinking Non-Functional

- Maintainability (Get it right early - not later)
- Testing (By design)
- Scalability (Low Memory)

You can prototype with the code but it encourages you to have polished code early.

What is Rust?

Based of the Rust Fungus. The logo is a bike ring because most of the developers who started Rust like to ride bikes

- Rustlings - Contains small exercises to get you used to reading and writing Rust code
- Exercism - Rust Track - Series of exercises to learn rust

```

            ]
        }
    }
}
```

Tools

RustFmt and Clippy

Editions

2021 is the current version - Install and upgrade with https://rustup.rs/

Every three years, 2015, 2018, 2021, 2024. Defaults to 2015 if you don't specify otherwise. Can have breaking changes. You can choose the edition in the Cargo.toml and choose when to upgrade. They provide tooling to automate the upgrade.

https://doc.rust-lang.org/edition-guide/editions/index.html

data,length,capacity
  - Slices: Borrow checker always ensures slices are aways valid at compile time
- Compile time errors
-

```
let mut shopping_list: Vec<&str> = Vec::new(); //Vec<&str> not needed as the compiler can infer it from the next line
shopping_list.push("milk");
```

- Lifetimes
- Return unit (empty tuple)
- Return Result and match //no try catch
- Optional Results

```
pub enum Option<T> {
    None,
    Some(T),
```

Controversy

- Leadership issues
- Trademark Policies
- Choice of Malware writers - 'RustDoor'
